

Problem-Solution Fit

Date	08/07/ 2026
Team ID	
Project Name	A comprehensive Measure of well being
Maximum Marks	5 Marks

Problem-Solution Fit Canvas:

The canvas below shows how the interactive HDI Predictor web app addresses the real root causes, behaviors, and limitations of policymakers, researchers, students, and citizens who currently rely on static, once-a-year HDI reports.

1. CUSTOMER SEGMENT(S) [CS] • Policymakers & government development planners • Development researchers, NGOs & think-tanks • University students/educators (economics, public policy) • Curious citizens & journalists tracking national progress	6. CUSTOMER LIMITATIONS [CL] eg. Budget, devices • Limited statistical/ML background among policymakers • Low budgets for premium analytics tools in developing-nation agencies • Access mostly via basic desktop/mobile browsers, low bandwidth	5. AVAILABLE SOLUTIONS [AS] Pros & Cons • UNDP official HDI report — authoritative, but static & updated only yearly • Python/R scripts — flexible, but require coding skill • Excel HDI templates — familiar, but manual & no predictive/what-if capability • Consulting reports — tailored, but expensive and slow
2. PROBLEMS / PAINS [PR] + its frequency • No easy way to estimate HDI tier without waiting for the annual UNDP release • Cannot simulate "what if schooling/income improves by X" — frequent need during budget season • Development data fragmented across multiple sources	9. PROBLEM ROOT / CAUSE [RC] • HDI has historically been a static, annually-published report with no accessible, real-time, scenario-based tool for non-technical users to predict tiers or get tailored improvement guidance	7. BEHAVIOR [BE] + its intensity • Search online for HDI rankings/calculators before budget cycles (High) • Manually recompute in spreadsheets (Medium) • Benchmark against peer countries before designing interventions (High)
3. TRIGGERS TO ACT [TR] • Upcoming policy/budget planning cycle • Academic assignment or research deadline • New UNDP report release sparking comparison curiosity • Need to justify a funding proposal with projected outcomes	10. YOUR SOLUTION [SL] An interactive HDI Predictor web app where users enter Life Expectancy, Education, and GNI per capita to instantly get a predicted HDI tier (Very High/High/Medium/Low). Interactive features: live-updating "what-if" sliders, color-coded tier gauge, weakest-indicator recommendation engine, side-by-side country/scenario comparison, and a downloadable PDF report.	8. CHANNELS OF BEHAVIOR [CH] ONLINE • Google search & UNDP website links • Academic forums, LMS platforms, LinkedIn policy circles
4. EMOTIONS [EM] Before / After		OFFLINE • Policy workshops & government training sessions

Before: Frustration and uncertainty from static data, guesswork, and scattered sources. After: Confidence and clarity — instant, explainable prediction with a clear improvement roadmap.		• University classroom lectures & conferences
